

Deliverable – Phase 1: Scratch Project

Description:

The Phase 1 scratch project has a few requirements:

- Your project could be a very simple web or app serving CRUD (Create, Read, Update, and Delete) functions. It should include two or three major functions.
- It can be running on a standalone local machine, like your own laptop.
- Any use of GenAI (e.g., Claude Code, ChatGPT, DeepSeek, etc.) is encouraged. If you decide not to use any GenAI, please state that clearly.
- Show your technical stack (e.g., Node.js, MySQL) and an overall architecture. Keep it as simple as possible.
- Do not spend days on this project! It took me only several hours with Claude Code to get it working, once I had figured out what I wanted to build.

Restrictions (Things you should not do at this point):

- No large-scale implementation, such as games or fancy graphics, etc.
- No need to upload your code to a code repository (e.g., GitHub).
- No need to run on cloud.

Grouping:

It's a pair project (group of two). So, find yourself a partner. Your partner could be someone from your Phase 2 group, or it could be anybody in class.

Goto: <https://docs.google.com/spreadsheets/d/13zWENBVqvxm5JlhRADibXRkM9nX25PsrBeM8tdim9M/edit?usp=sharing>

Document:

~~You should submit and print out a single-page poster for your demo.~~

Submit a single-page poster for your demo – one per group – on LMS: cse406-phase-1-poster-submission (deadline: 13:00, Oct. 9). And I will share all the posters with the class afterward.

Demo:

~~Each group will be given a 3-minutes presentation in class. You should present a main page and a short sequence of your major functions.~~

~~Dates will be discussed in class.~~

There will be no offline class on Oct. 9. Instead, each group posts a 3-minute YouTube demo (e.g., show your implementation and explain briefly). It's maximum 3 mins. Please add your YouTube link to the Phase 1 google spreadsheet. And don't forget to submit your poster on LMS online. Everyone is expected to watch watch all the videos.

Termination:

None of the code here should be reused for your Phase 2 project. Everything should be discarded.

Assessment:

It will be peer reviewed via a quick class vote and of course, assessed independently by me.

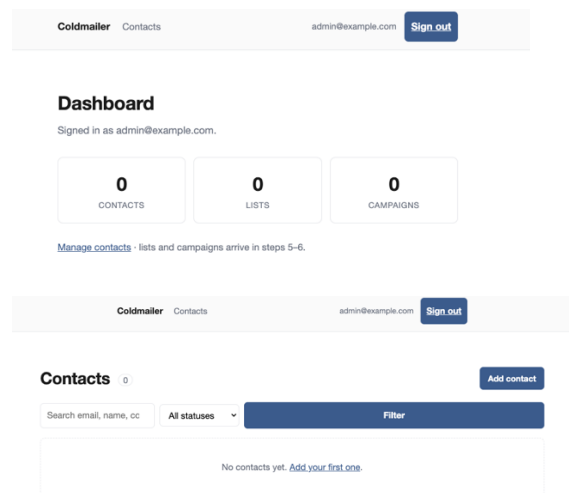

Cold eMailer

Youngjoon Won, Jiwoo Won

Description (One sentence):

This web service can send emails to multiple recipients on regular and schedule basis.

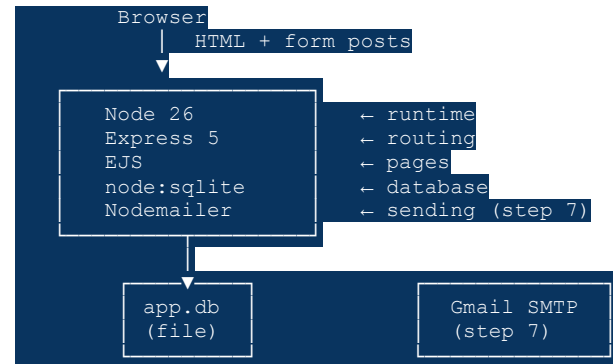

Screenshots:

Key Features:

- +Send emails to multiple recipients (add/remove/modify).
- +Send emails on schedule.
- +Provide Gmail like on-line editor in web browser.
- +System log in.

Architecture: (From AI)

Tools:

Claude Code (Opus 5)
Kubernetes
Python3.12

Platform:

Mac OS Tahoe 26.6.2
Windows 11

On the day of demo, our classroom will look like the following:

Each round will have ten groups presenting at the same time, and students are free to visit any group. I will visit one group at a time (again 3 mins per group):
